The **SDK** folder contains all you need to start programming with the CRIWARE SDK.

The CRIWARE SDK's 3 components

The run-time part of the CRIWARE SDK is composed of 3 components:

- **CRIAtomEx** is the **ADX2** run-time component.
  It plays the audio data authored in the **AtomCraft** tool.

- **CRIMana** is the **Sofdec2** run-time component.
  It plays the video data encoded with the **Sofdec2 Encoding Wizard** for example.

- **CRIFileSystem** is the run-time component of the file system.
  It can load **CPK** files among other things.

The names of the files in the SDK - for example include files, libraries or sample projects - always refer to these 3 components.

The native PC version of the SDK

This is the native PC version of the CRIWARE SDK. The **SDK** folder contains 3 subfolders:

- The **common** folder contains common data used by the sample code.

- The **documentation** folder contains detailed manuals about the APIs.

- The **pc** folder contains the files used to program with the CRIWARE SDK on PC. In particular, you can find the include files, the libraries, as well as many sample projects.
